

ABSTRACT OF THE DISCLOSURE

This invention is intended to improve a sealability for the sealing between a cover member and a container main body and to improve a detachability of the cover member. A double-seal mechanism is provided on the cover member. The double-seal mechanism includes an inner seal piece that seals an interior of the container main body while being put between an inner seal reception section and a seal pressing section, and an outer seal piece that seals an abutment portion between the inner seal piece and the inner seal reception section. The bulge section fitted into the fitting groove is provided on a tip end of the inner seal piece. A cover member fixing unit of the cover member includes a latch shaft that is linearly projected from and retracted toward the cover member, a latch roller attached to a tip end of the latch shaft, and a crank mechanism that linearly projects and retracts the latch shaft from and toward the cover member when the crank mechanism rotates. A cover member retracting surface for retracting the cover member toward the container main body while the latch roller rotates is provided on the container main body.
